

Preparing environnement	
mkdir projec t_name && cd \$_	Create project folder and navigate to it
python -m venv env_name	Create venv for the project
source env_na me \bin \ac tivate	Activate environnement (Replace "bin" by "Scripts" in Windows)
pip install django	Install Django (and others dependencies if needed)
<pre>pip freeze > requir eme nts.txt</pre>	Create requirements file
pip install -r requir eme nts.txt	Install all required files based on your pip freeze command
git init	Version control initialisation, be sure to create appropriate gitignore

Create project

django -admin startp roject mysite (or I like to call it confi directory the manage.py file

python manage.py runserver

This will create a mysite directory in your current directory the manage.py file

You can check that everything went fine

Database Setup

Open up mysite /se tti ngs.py	It's a normal Python module with module-level variables representing Django settings.
<pre>ENGINE - 'djang o.d b.b ack end s.s qlite3', 'djang o. d b.b ack end s.p ost gresql', 'djang o.d b.b ack end s.m ysql', Or 'djang o.d b.b ack end s.o racle'</pre>	If you wish to use another database, install the appropriate database bindings and change the following keys in the DATABASES 'default' item to match your database connection settings
${\tt NAME-The\ name\ of\ your\ database.}\ If\ you're\ using\ SQLite,\ the$ database will be a file on your computer; in that case, NAME should be the full absolute path, including filename, of that file.	The default value, ${\tt BASE_DIR}$ / 'db.sq lite3', will store the file in your project directory.
If you are not using SQLite as your database, additional settings such as USER, PASSWORD, and HOST must be added.	For more details, see the reference documentation for DATABASES.

Creating an app

o		
python manage.py startapp app_name	Create an app_name directory and all default file/folder inside	
INSTAL LED _APPS = [Apps are "plugable", that will "plug in" the app into the project	
'app_name',

Django Cheat Sheet

by Olivier R. (OGR) via cheatography.com/143343/cs/30794/

Creating an app (cont)

```
urlpat terns = [
 path('app_name/', include('app_name.urls')),
 path('admin/', admin.s it e.u rls),
```

Into urls.py from project folder, inculde app urls to project

Creating models

Class ModelN ame (mo del s.M odel)	Create your class in the app_name/models.py file
<pre>title = models.Ch arF iel d(m ax_ len gt h =100)</pre>	Create your fields
<pre>defstr(self): return self title</pre>	It's important to addstr() methods to your models, because objects' representations are used throughout Diango's automatically-generated admin.

Database editing

<pre>python manage.py makemi gra tions (app_nam e)</pre>	By running makemigrations, you're telling Django that you've made some changes to your models
python manage.py sqlmigrate #ident ifier	See what SQL that migration would run.
python manage.py check	This checks for any problems in your project without making migrations
python manage.py migrate	Create those model tables in your database
python manage.py shell	Hop into the interactive Python shell and play around with the free API Django gives you

Administration

python manage.py create sup eruser	Create a user who can login to the admin site
admin.s it e.r egi ste r(M ode lName)	Into app_name/admin.py, add the model to administration site
http://127.0.0.1:8000/admin/	Open a web browser and go to "/admin/" on your local domain

Management

touch your_c omm and _na me.py

Create a python file with your command name

By **Olivier R.** (OGR) cheatography.com/ogr/

Published 6th February, 2022. Last updated 12th February, 2022. Page 2 of 8.

Django Cheat Sheet

by Olivier R. (OGR) via cheatography.com/143343/cs/30794/

Management (cont)

from django.co re.m an age men t.base import BaseCommand

#import anything else you need to work with (models?)

class Command(BaseCommand):
 help = "This message will be shon with the --help option after your command"

def handle (self, args, *kwargs):
 # Work the command is supposed to do

python manage.py my_cus tom _co mmand

And this is how you execute your custom command

Django lets you create your customs CLI commands

Write your first view

```
from django.http import HttpResponse
def index(request):
    return HttpRe spo nse ("Hello, world. You're at the index
." )

from django.urls import path
from . import views

app_name = "app_name"
urlpatterns = [
    path('', views.i ndex, name='index'),
    ]

Open the file app_name/views.py and put the following
Python code in it.
This is the simplest view possible.

In the app_name/urls.py file include the following code.
```

View with argument

def detail (re quest, question_id):
 return HttpRe spo nse (f"Y ou're looking at question {quest ion _id
}")

urlpat terns = [
 path('<int:question_id>/', views.d etail, name='detail'),
 ...

{% url 'app_n ame :vi ew_ name' questi on_id %}

Exemple of view with an arugment

See how we pass argument in path

We can pass attribute from template this way

By **Olivier R**. (OGR) cheatography.com/ogr/

Published 6th February, 2022. Last updated 12th February, 2022. Page 3 of 8.

View with Template	
app_na me/ tem pla tes /ap p_n ame /in dex.html	This is the folder path to follow for template
<pre>context = {'key': value}</pre>	Pass values from view to template
<pre>return render (re quest, 'app_n ame /in dex.html', conte xt)</pre>	Exemple of use of render shortcut
{% Code %}	Edit template with those. Full list here
{{ Variavle from view's context dict }}	
<a href="{<math>%</math> url 'detail' questi on.id <math>%</math>}"> 	
<ti tle="">Page Title< /ti tle></ti>	you can put this on top of your html template to define page title

Add some static files	
'djang o.c ont rib.st ati cfiles'	Be sure to have this in your INSTALLED_APPS
STATIC_URL = 'static/'	The given exemples are for this config
<pre>mkdir app_na me/ static app_na me/ sta tic /ap p_name</pre>	Create static folder associated with your app
{% load static %}	Put this on top of your template
<pre><link href="{% static 'app_n ame /st yle. css' %}" rel="st yle she et" type="t ext /cs s"/></pre>	Exemple of use of static.

Raising 404	
raise Http40 4("Q uestion does not exist")	in a try / except statement
<pre>question = get_ob jec t_o r_4 04(Que stion, pk=que sti on_id)</pre>	A shortcut

Forms	
app_na me/ for ms.py	Create your form classes here
from django import forms	Import django's forms module
from .models import YourModel	import models you need to work with
<pre>class ExempleForm(forms.Form): exemple_field = forms.C ha rFi eld (la bel ='E xemple label', max_le n gt h=100)</pre>	For very simple forms, we can use simple Form class
<pre>class ExempleForm(forms.ModelForm): class meta: model = model_name fields = ["fields"] labels = {"te xt": "label_text"} widget = {"te xt": forms.w id get _name}</pre>	A ModelForm maps a model class's fields to HTML form <input/> elements via a Form. Widget is optional. Use it to override default widget
TextInput, EmailI nput, Passwo rdI nput, DateInput, Textarea	Most common widget list
if reques t.m ethod != "POST":	Create a blank form if no data submitted

Forms (cont)	
form = Exempl eFo rm(dat a=r equ est.POST)	The form object contain's the informations submitted by the user
	4301
is form.isvalid()	Form validation. Always use redirect function
form.save()	
return redire ct(" app _na me: vie w_n ame ", argume nt	
= ard ument)	
{% csrf token %}	Template tag to prevent "cross-site request forgery" attack

Render Form In Template		
{{ form.as_p }}	The most simple way to render the form, but usualy it's ugly	
<pre>{{ field pla ceh old er: fie ld.l abel }} {{ form.u ser nam e p lac eho lde r:"Your name here"}}</pre>	The is a filter, and here for placeholder, it's a custom one. See next section to see how to create it	
<pre>{% for field in form %} {{form.username}}</pre>	You can extract each fields with a for loop. Or by explicitly specifying the field	

Custom template tags and filters	
app_na me \tem pla tet ags \ ini tpy	Create this folder and this file. Leave it blank
app_na me \tem pla tet ags \fi lte r_n ame.py	Create a python file with the name of the filter
{% load filter _name %}	Add this on top of your template
<pre>from django import template register = templa te.L ib rary()</pre>	To be a valid tag library, the module must contain a module-level variable named register that is a template.Library instance
<pre>@regis ter.fi lte r(n ame ='cut') def cut(value, arg): " " " Removes all values of arg from the given string " " " return value.r ep lac e(arg, '')</pre>	Here is an exemple of filter definition. See the decorator? It registers your filter with your Library instance. You need to restart server for this to take effects
https://tech.serhatteker.com/post/2021-06/placeholder-templatetags/	Here is a link of how to make a placeholder custom template tag

By **Olivier R.** (OGR) cheatography.com/ogr/

Published 6th February, 2022. Last updated 12th February, 2022. Page 5 of 8.

login(request, new_user)

context = {"fo rm": form}

return redirect("app name:index")

return render (re quest, " reg ist rat ion /re gis ter.ht ml", context)

Django Cheat Sheet

by Olivier R. (OGR) via cheatography.com/143343/cs/30794/

Setting Up User Accounts Create a "users" app Don't forget to add app to settings.py and ir app_name = "users" Inside app_name/urls.py (create it if inexiste this code includes some default authentifica urlpatterns[Diango has defined. # include default auth urls. path("", include("django.contribe.auth.urls")) {% if form.error %} Basic login.html template Save it at save template as Your username and password didn't match users/templates/registration/login.html {% endif %} We can access to it by using <form method ="po st" action ="{% url 'users :login' %}"> <a href="{% url 'users :login' % {% csrf_token %} {{ form.as p }} <button name="s ubm it">Log in</button> <input type="h idd en" name="n ext " value= " {% url 'app_n ame :index'</pre> 응}" /> </form> {% if user.i s a uth ent icated %} Check if user is logged in {% url " use rs: log out " %} Link to logout page, and log out the user save template as users/templates/registrati out.html path("r egi ste r/", views.r eg ister, name="r egi ste r"), Inside app_name/urls.py, add path to regist from django.sh ortcuts import render, redirect We write our own register() view inside use For that we use UserCreationForm, a djang from django.co ntr ib.auth import login model. from django.co ntr ib.f orms import UserCreationForm If method is not post, we render a blank for Else, is the form pass the validity check, an def register(request): We just have to create a registration.html to if reques t.m ethod != "POST": folder as the login and logged_out form = UserCreationForm() form = UserCreationForm(data=request.POST) if form.is valid(): new user = form.save()

Allow Users to Own Their Data	
from django.co ntr ib.a ut h.d eco rators import login_required @login_required def my_view(request)	Restrict access with @login_required decorator If user is not logged in, they will be redirect to the login page To make this work, you need to modify settings.py so Django knows where to find the login page Add the following at the very end # My settings
	LOGIN_URL = " use rs: log in"
<pre>from django.co ntr ib.a ut h.m odels import User owner = models.Fo rei gnK ey(User, on_del ete =mo del s.C - ASCADE)</pre>	Add this field to your models to connect data to certain users When migrating, you will be prompt to select a default value
<pre>user_data = Exempl eMo del.ob jec ts.f il ter (ow ner =re q ue st.u ser)</pre>	Use this kind of code in your views to filter data of a specific user request.user only exist when user is logged in
<pre>from django.http import Http404 if exempl e d ata.owner != request.user:</pre>	Make sure the data belongs to the current user If not the case, we raise a 404
raise Http404	
<pre>new_data = form.save(commit=false) new_data.owner = request.user new_data.save()</pre>	Don't forget to associate user to your data in corresponding views The "commit=false" attribute let us do that

Paginator	
from django.co re.p ag inator import Paginator	In app_name/views.py, import Paginator
<pre>exempl e_list = Exempl e.o bje cts.all()</pre>	In your class view, Get a list of data
<pre>paginator = Pagina tor (ex emp le_ list, 5) # Show 5 items per pag e.</pre>	Set appropriate pagination
<pre>page_n umber = reques t.G ET.g et ('p age')</pre>	Get actual page number
<pre>page_obj = pagina tor.ge t_p age (pa ge_ number)</pre>	Create your Page Object, and put it in the context
<pre>{% for item in page_obj %}</pre>	The Page Object acts now like your list of data
